TSX: NCU

Nevada Copper Continues to Expand Open Pit Mineralization and Provides Positive Project Update

June 19, 2018 - Nevada Copper Corp. (TSX: NCU) (“Nevada Copper” or the “Company”) is pleased to provide an operations and drill results update regarding the Underground and Open Pit projects at its 100%-owned, fully-permitted Pumpkin Hollow Project in Nevada.

Highlights

- **Early Underground construction works ramping up:**
 - Early construction works continue to ramp-up at the Pumpkin Hollow Underground project.
 - Works ahead of the completion of the final 237 ft of the existing 1,900 ft shaft, and preparations for the ramp-up of development mining, underway by Cementation.
 - Project team continues to expand with a number of key hires.
- **2018 drill program already yielding positive results, including potential further extension of the north pit deposit:**
 - *Multiple new zones of mineralization encountered:* 20 drill holes completed to-date, with all holes encountering multiple zones of mineralization. Importantly, newly discovered mineralization sits within the existing open pit shell design and may convert areas that have been classified as waste into ore. This has the potential to further reduce waste stripping ratios and enhance project economics.
 - *Mineralization expanded in Northern Extension Zone:* New zones of mineralization encountered in the Open Pit Northern Extension. Hole NC18-04 intersected multiple zones of copper mineralization, including **38.2 meters true thickness averaging 1.11% copper**, with thicker mineralization than adjacent holes.
 - *Core Zone expanded to west:* Drilling to the west of the currently defined limit of the North Pit ore body has intersected new mineralization in areas adjacent to the North Pit Core Zone currently classified as waste, and could indicate a further extension of the ore body to the west.
- **Positive Open Pit Study progress:**
 - Previously announced Golder Associates Open Pit optimization study is progressing well with the target of defining a future phased approach to Open Pit development, via a lower-capex, higher-margin Phase 1 Open Pit with optionality over future expansions.
 - Based on the progress of the work completed to-date, the Company is working to prepare a study for release in the coming months.

Matt Gili, President and Chief Executive Officer, commented, “We continue to make solid progress towards our goal of first production from the Pumpkin Hollow Underground Project with continued achievement of timely project milestones. Delivery of the Underground Mine is the first key step in executing on our strategy of sustainable cash generation with capital efficiency and high project returns, while also maximizing our options for phased production expansions.”

“We are also pleased to see continued positive progress in the application of the same ‘margin-over-tonnes’ philosophy to our open pit mine.” Gili added, “The 2018 drill program continues to support our target of converting waste to ore, and the ongoing work by Golder Associates is focused on the strong potential benefits of a phased approach to open pit development at an appropriate time in the future.”

Golder Associates Study Update

- **Focus on phased development approach:** The ongoing work by Golder Associates targets a reduced-capital, higher-return initial open pit phase.
- **Increased mining grades:** The engineering work targets a first phase of the Open Pit with potential mined grades of approximately 0.55% over a long mine life.

- **Reduced waste stripping:** Additional pit shell engineering design work would prioritize project returns over scale, including a reduced stripping ratio which if successful would allow for significant improvements to pre-production capital and related operating costs.
- **Reduced capital:** The ongoing work targets a reduced initial production scale of approximately 30,000 to 40,000 tonnes per day and a smaller mining fleet, with the objective of significantly reducing capital expenditures to around half of the amount contemplated in the existing technical study.
- **Growth optionality retained:** It is intended that the first phase of the Open Pit would not sterilize remaining mineral resources, and that optionality would be retained over a second phase extension and potential expansion.
- **Further upside being defined:** The success of the ongoing 2018 drill program has the potential to provide further upside to the work completed to-date.

The Open Pit optimization study work remains ongoing with the aim of releasing a preliminary study over the coming months, which the Company expects to subsequently be updated to incorporate the Company’s 2018 Resource Update following completion of the currently ongoing drill program.

North Pit Drilling – Detailed Results

Drill hole NC18-03 is located in the eastern edge of the core area of the North Pit Core Zone. The drill hole targeted areas of inferred or waste below existing mineralization, and within the pit limits. The hole successfully intersected several new zones below the existing mineralization.

Drill hole NC18-04 is located in the Northern Extension Zone. The main zone of mineralization intersected 38.2 meters true thickness averaging 1.11% copper which was thicker than the adjacent holes. This indicates that the mineralized zone continues to extend to the north. Additional offset holes are planned as part of the ongoing drill program.

Drill hole NC18-05 is also located in the North Pit Core Zone and targeted the inferred and waste areas below existing mineralization. Like NC18-03, this new mineralization intersected areas currently classified as waste.

Drill hole NC18-07 is located in the Northern Extension Zone. The hole intersected two new shallow mineralized zones. The other zones intersected continue to expand the mineralization to the north. Additional off set holes are planned as part of the ongoing drill program.

Drill hole NC18-08 is also located in the Northern Extension Zone and targeted the expansion of existing mineralization. The mineralization intersected continues to support the potential to convert waste into ore.

Drill hole NC15-20 was a hole pre-collared in 2015 and completed as part of this year's program. The hole is located along the western edge of the North Pit Core Zone. The drill hole had targeted areas of waste and within the pit limit. New shallower mineralization was discovered and the lower zones were thicker than the adjacent hole. This indicates that mineralization is open to the west and south.

The table below summarizes the recent assay results. The 2018 drill program is ongoing and assays for the subsequent drill holes will be posted as results are received.

Hole #	From	To	Length	True Length	Cu	Gold	Silver	CuEq*
	(m)	(m)	(m)	(m)	%	(g/t)	(g/t)	%

About Nevada Copper

Nevada Copper (TSX: NCU) owns Pumpkin Hollow - the only major, shovel-ready and fully-permitted copper project in North America. Located in Nevada, USA, Pumpkin Hollow has substantial reserves and resources including copper, gold and silver.

Its two fully-permitted projects include: the high-grade Pumpkin Hollow underground mine which is expected to move into construction shortly with a view to near-term commencement of copper production; and the Pumpkin Hollow open pit, a large-scale copper deposit which is currently undergoing an optimization program to target a reduced-capex, staged-development approach.

Cautionary Language

This news release includes certain statements and information that may contain forward-looking information within the meaning of applicable Canadian securities laws. All statements in this news release, other than statements of historical facts are forward-looking statements. Such forward-looking statements and forward-looking information specifically include, but are not limited to, statements concerning: the planned completion of further feasibility and technical studies in respect of the Pumpkin Hollow Project, the objectives of those studies and other plans of Nevada Copper Corp. with respect to the development, construction and commercial production (the "Company") at the Pumpkin Hollow Project.

Often, but not always, forward-looking statements and forward-looking information can be identified using words such as "plans", "expects", "potential", "is expected", "anticipated", "is targeted", "budget", "scheduled", "focused", "estimates", "forecasts", "intends", "anticipates", or "believes" or the negatives thereof or variations of such words and phrases or statements that certain actions, events or results "may", "could", "would", "might" or "will" be taken, occur or be achieved. Forward-looking statements or information include, but are not limited to, statements or information with respect to known or unknown risks, uncertainties and other factors which may cause actual results, performance or achievements to be materially different from any future results, performance or achievements expressed or implied by such forward-looking statements or information.

Forward-looking statements or information are subject to a variety of risks and uncertainties which could cause actual events or results to differ from those reflected in the forward-looking statements or information, including, without limitation, risks and uncertainties relating to: history of losses; requirements for additional capital; dilution; loss of material properties; interest rate increases; global economy; no history of production; future metals price fluctuations, speculative nature of exploration activities; periodic interruptions to exploration, development and mining activities; environmental hazards and liability; industrial accidents; failure of processing and mining equipment to perform as expected; labor disputes; supply problems; uncertainty of production and cost estimates; the interpretation of drill results and the estimation of mineral resources and reserves; changes in project parameters as plans continue to be refined; possible variations in ore reserves, grade of mineralization or recovery rates may differ from what is indicated and the difference may be material; legal and regulatory proceedings and community actions; accidents, title matters; regulatory restrictions; permitting and licensing; volatility of the market price of the Company's common shares; insurance; competition; hedging activities; currency fluctuations; loss of key employees; other risks of the mining industry as well as those factors discussed in the section entitled "Risk Factors" in the Company's Annual Information Form dated March 28, 2018. Should one or more of these risks and uncertainties materialize, or should underlying assumptions prove incorrect, actual results may vary materially from those described in forward-looking statements or information. In addition, there can be no assurance regarding the outcome of the Company's ongoing technical study work or the achievement or timing of the Company's exploration, development, construction or commercial production objectives. The Company disclaims

any intent or obligation to update forward-looking statements or information except as required by law, and readers are referred to the full discussion of the Company's business contained in the Company's reports filed with the securities regulatory authorities in Canada. Although the Company has attempted to identify important factors that could cause actual results to differ materially, there may be other factors that could cause results not to be as anticipated, estimated or intended. For more information on Nevada Copper and the risks and challenges of its business, investors should review Nevada Copper's annual filings that are available at www.sedar.com.

The Company provides no assurance that forward-looking statements will prove to be accurate, as actual results and future events could differ materially from those anticipated in such statements. Accordingly, readers should not place undue reliance on forward-looking statements.
